While you can create and manipulate text in Photoshop, there are other graphic design applications for this purpose. See the nearby sidebar for a list of some common text-editing programs, such as Adobe InDesign or QuarkXpress. Getting to Know the Editor and its Primary Operations Photoshop CS3 and later include a program editor similar to the basic drawing program and canvas that you use when creating and animating. When you start the program, a window called the Photoshop CS3 editor appears; it allows you to change the settings for your new project and display your work. When you're editing your Photoshop document, you may

need to toggle the program's editor from view, or you may need to use the foreground or background view. To toggle the Photoshop editor from view, select Edit and either choose Photoshop Editor from the top of the menu bar, or choose Window? Photoshop Editor. (Depending on the version of Photoshop you're using, the editing window may be called the Photoshop CS3 editor or the Photoshop CS3 area.) Depending on which version of Photoshop you're using, you also have different versions of the Photoshop Editor. However, the editing process for the basic features, such as drawing, are always the same. Projects typically begin in the Photoshop editor in either the foreground or background view, which depends on whether you're

viewing your project on the monitor or the hard drive. For a walk-through tutorial on using the Photoshop editor, review this video: Use the following steps to create a document in Photoshop: 1. Open Photoshop. 2. On the menu bar, choose File?New. 3. Pick an appropriate file type and size, and then click OK. Here's why Photoshop gives you this option: You usually don't want to create a raster image file — you want to use it as a vector image. (Vector images are usually created in a very simple, non-scanned format that's much smaller than a file of raster images. You can make your own Photoshop document, choosing File?New as shown in the preceding steps. 4. Now the New Document dialog box appears. (Refer to

Coos County, New Hampshire We're less than two weeks away from Apple's iPhone 6 event on September 9, where the company will announce its next generation of iPhones. The event is scheduled to start at 10AM PT/1PM ET/6PM BST, and I'll be on the ground reporting live at this location. Because of events like this, there are always lots of rumours flying around as to what Apple will do with the next-generation iPhone. One of the most exciting things about the upcoming iPhone is that Apple is expected to unveil new versions of both the iPhone and the iPad with Retina Displays (often shortened to "iPhone 6 and iPad Air 2"). Rumours surrounding these devices have been flying around for months, and have remained largely

consistent over the past few weeks. The latest evidence from a well-known Apple insider suggests that there's one other device that will be joining the iPhone and iPad line-up this fall. We've been privy to the info for quite some time, and while we can't confirm this info, it appears that another model of Apple's smartphone will be available that's set to rival the iPhone 5C. A new iPhone starting at \$149? Now that Apple has completed its buyout of Beats Electronics, the odds are increasing that Apple will bring its own branded headphones to the market. Last week, the iPhone 5C was revealed, marking the latest step in the company's turnaround of the budget iPhone. At the same time, the headphone market has a few new players: Bowers & Wilkins,

Monster, and Sony

Q: Matplotlib rotate image 90 degrees
I'm trying to write a function which is supposed to rotate an image by 90 degrees. I can get it to work to rotate it by 90 degrees in my test code, but not in a function which is supposed to take the original image as a parameter and return a rotated image. Here is my test code:

```
import numpy as np import
matplotlib.pyplot as plt def
rotate_image(image, degrees):
new_image = np.rot90(image)
plt.imshow(new_image) plt.show() X, Y =
100, 100 image = plt.imread('trash.png')
X, Y = 100, 100 # Function to rotate the
image 90 degrees
```

`print(rotate_image(image, 90))` Which spits out the desired rotated image. However, I cannot work out how to get it to work in the following function: `def rotate_image(image, degrees):`
`new_image = np.rot90(image)`
`plt.imshow(new_image) plt.show()` return `rotated_image` It just spits out the original image. I imagine it's something to do with the line `plt.imshow(new_image)`, but I've tried multiple combinations and can't figure it out. A: Your function returns an image. For that the input image needs to be specified in the function as the return value too. `def rotate_image(image, degrees):` `new_image = np.rot90(image)`
`plt.imshow(new_image) plt.show()` return `new_image` Tag Archives: religion We
